

## Abstract of the Disclosure

A steering support member structure is to be provided, which can be easily produced in a form of an elongate shape with a production cost reduced in connection with a die and a casting equipment even when the steering support member structure is constituted by a light alloy. The steering support member structure includes a steering support member body constituted by the light alloy and adapted to be arranged almost in a vehicle width direction in a front portion of a vehicle interior. The steering support member body is divided into a first member having a driver seat side portion and a central portion and a second portion having a front passenger seat portion.
